

INTERPRETIVE AND EDUCATION CENTER Site Selection Report

Warren, Washington, Yazoo, Humphreys, Issaquena, and Sharkey Counties, Mississippi

United States Army Corps of Engineers
Vicksburg District
4155 Clay Street
Vicksburg, Mississippi 39183
July, 2007

Prepared by:
Gulf South Research Corporation
8081 GSRI Avenue
Baton Rouge, Louisiana 70820

EXECUTIVE SUMMARY

The United States Army Corps of Engineers (USACE) was authorized by the U.S. Congress to design and construct an Interpretive and Education Center (IEC) in the Mississippi South Delta region. The South Delta region is defined as in Sharkey, Issaquena, Yazoo, Humphreys, Warren and Washington counties. The authorization can be found in Section 145 (Subsection f) of the Consolidated Appropriations Act, 2004 (Public Law [P.L.]108-199) and states :

“(f) EDUCATION CENTER- The Secretary of the Army, acting through the Chief of Engineers, in consultation with the Secretary, shall design and construct a multi-agency wildlife and environmental interpretive and education center at a location in the South Delta area of the State to be determined by a site selection and feasibility study conducted by the Secretary of the Army”

This report documents the results of the “site selection” analysis as authorized by P.L. 108 – 199. As part of the site selection process, the USACE sought public involvement through stakeholder and community meetings. The purpose of the meetings was to inform the stakeholders of the status and process of planning the IEC, obtain a consensus of IEC’s concept, and solicit input regarding issues for site selection. Letter invitations were sent to 37 public officials and agency representatives.

USACE conducted a stakeholder meeting to provide initial information about the IEC; solicit input regarding the themes, concepts and features; and solicit input on site selection. The meeting was held at the Sharkey-Issaquena Counties Public Library in Rolling Fork, Mississippi, on September 21, 2006 from 6:00 pm until 8:00 pm. US Congressman Bennie Thompson (D–MS) also held a community meeting at South Delta High School in Rolling Fork, Mississippi. The meeting, held November 1, 2006 from 6:00 pm until 8:00 pm, covered a variety of topics, including the IEC. Congressman Thompson invited the Vicksburg District to participate in the discussion, answer community questions, and accept comments and suggestions.

The final site selection criteria were based on input from both communities and stakeholders. Based on the aforementioned meetings, the public expressed a desire to have the following criteria considered for the final site selection analysis:

- Proximity to natural resources, historic sites, and other public interests
- Logistics (transportation routes, utilities, emergency services)
- Other concerns such as the floodplain, educational opportunities, environmental issues, and development potential.

Geographic Information System (GIS) analysis selected 74 sites within 5 miles of the major transportation corridors (U.S. Highway 61 and 49) within the South Delta region during the initial screening process. After the reconnaissance of these 74 sites, USACE determined that the proximity of the legendary Theodore Roosevelt and Holt Collier bear hunt site should be the highest weighted value of the site selection criteria. The 1902 hunting expedition searched for bear in the area between Smedes and Onward, Mississippi. Therefore, sites located within this general area were included in the second, more focused round of analysis. The revised distance parameter produced 38 potential sites in Sharkey, Issaquena, Humphreys, and Washington counties. The 38 sites were assessed, scores were calculated using weighted factors, and the 15 highest scores were identified. The 15 highest scoring sites are located in Sharkey and Issaquena Counties.

1.0 PURPOSE AND OBJECTIVE

1.1 Introduction

The purpose of this report is to assess potential sites in the Mississippi South Delta region for the proposed construction of an Interpretive and Education Center (IEC). The Mississippi Delta resides in the northwest section of the State of Mississippi that lies between the Mississippi and Yazoo Rivers. This area encompasses all or part of Warren, Washington, Yazoo, Humphreys, Lissaquena, and Sharkey Counties. This region, created by regular flooding over thousands of years, is a flat plain and contains some of the most fertile soil in the world (Figure 1).

The United States Army Corps of Engineers (USACE) was authorized by the U.S. Congress to design and construct an Interpretive and Education Center (IEC) in the Mississippi South Delta region. The authorization can be found in Section 145 (Subsection f) of the Consolidated Appropriations Act, 2004 (Public Law [P.L.]108-199) and states:

“(f) EDUCATION CENTER- The Secretary of the Army, acting through the Chief of Engineers, in consultation with the Secretary, shall design and construct a multi-agency wildlife and environmental interpretive and education center at a location in the South Delta area of the State to be determined by a site selection and feasibility study conducted by the Secretary of the Army”

The IEC will be a multi-agency facility that will provide training and educational opportunities for the Federal and state resource agencies and the general public. The IEC will include educational information on the agricultural activities, blues music, flood control, ecological and geological processes, and other economical and historical influences in the region such as the historical 1902 bear hunt by President Theodore Roosevelt and his legendary African American hunting guide Holt Collier. The objective of the site selection analysis was to identify areas that would be suitable for an IEC. Criteria such as the presence of natural resources onsite, distance to nearest schools, the quality of the forest stand onsite, location relative to floodplains, and the availability of paved access roads to the site were used to assess the suitability of sites within the South Delta region.

1.2 Scope of Analysis

The scope of the analysis encompassed the South Delta region. Based on public input, and experience at other interpretive centers and knowledge of the region, it was determined that most visitors traveling along the two major corridors in the South Delta region (U.S. Highway 61 or U.S. Highway 49) would not venture further than 5 miles to visit a local attraction. Therefore, a 5-mile study area around U.S. Highway 61 and 49 was created. The southern end of the study area along U.S. Highway 61 started just south of the town of Valley Park, Mississippi and the northern end included the towns of Leland and Helm, Mississippi. On U.S. Highway 49, the northern end of the study zone includes the townships of Isola, Milroy, and Cable and the southern end begins just northwest of Yazoo City, Mississippi (Figure 2).

2.0 SITE SELECTION METHODS

2.1 Public Meetings

USACE, Vicksburg District, conducted a stakeholder meeting to provide initial information about the IEC: solicit input regarding the themes, concepts and features; and solicit input on site

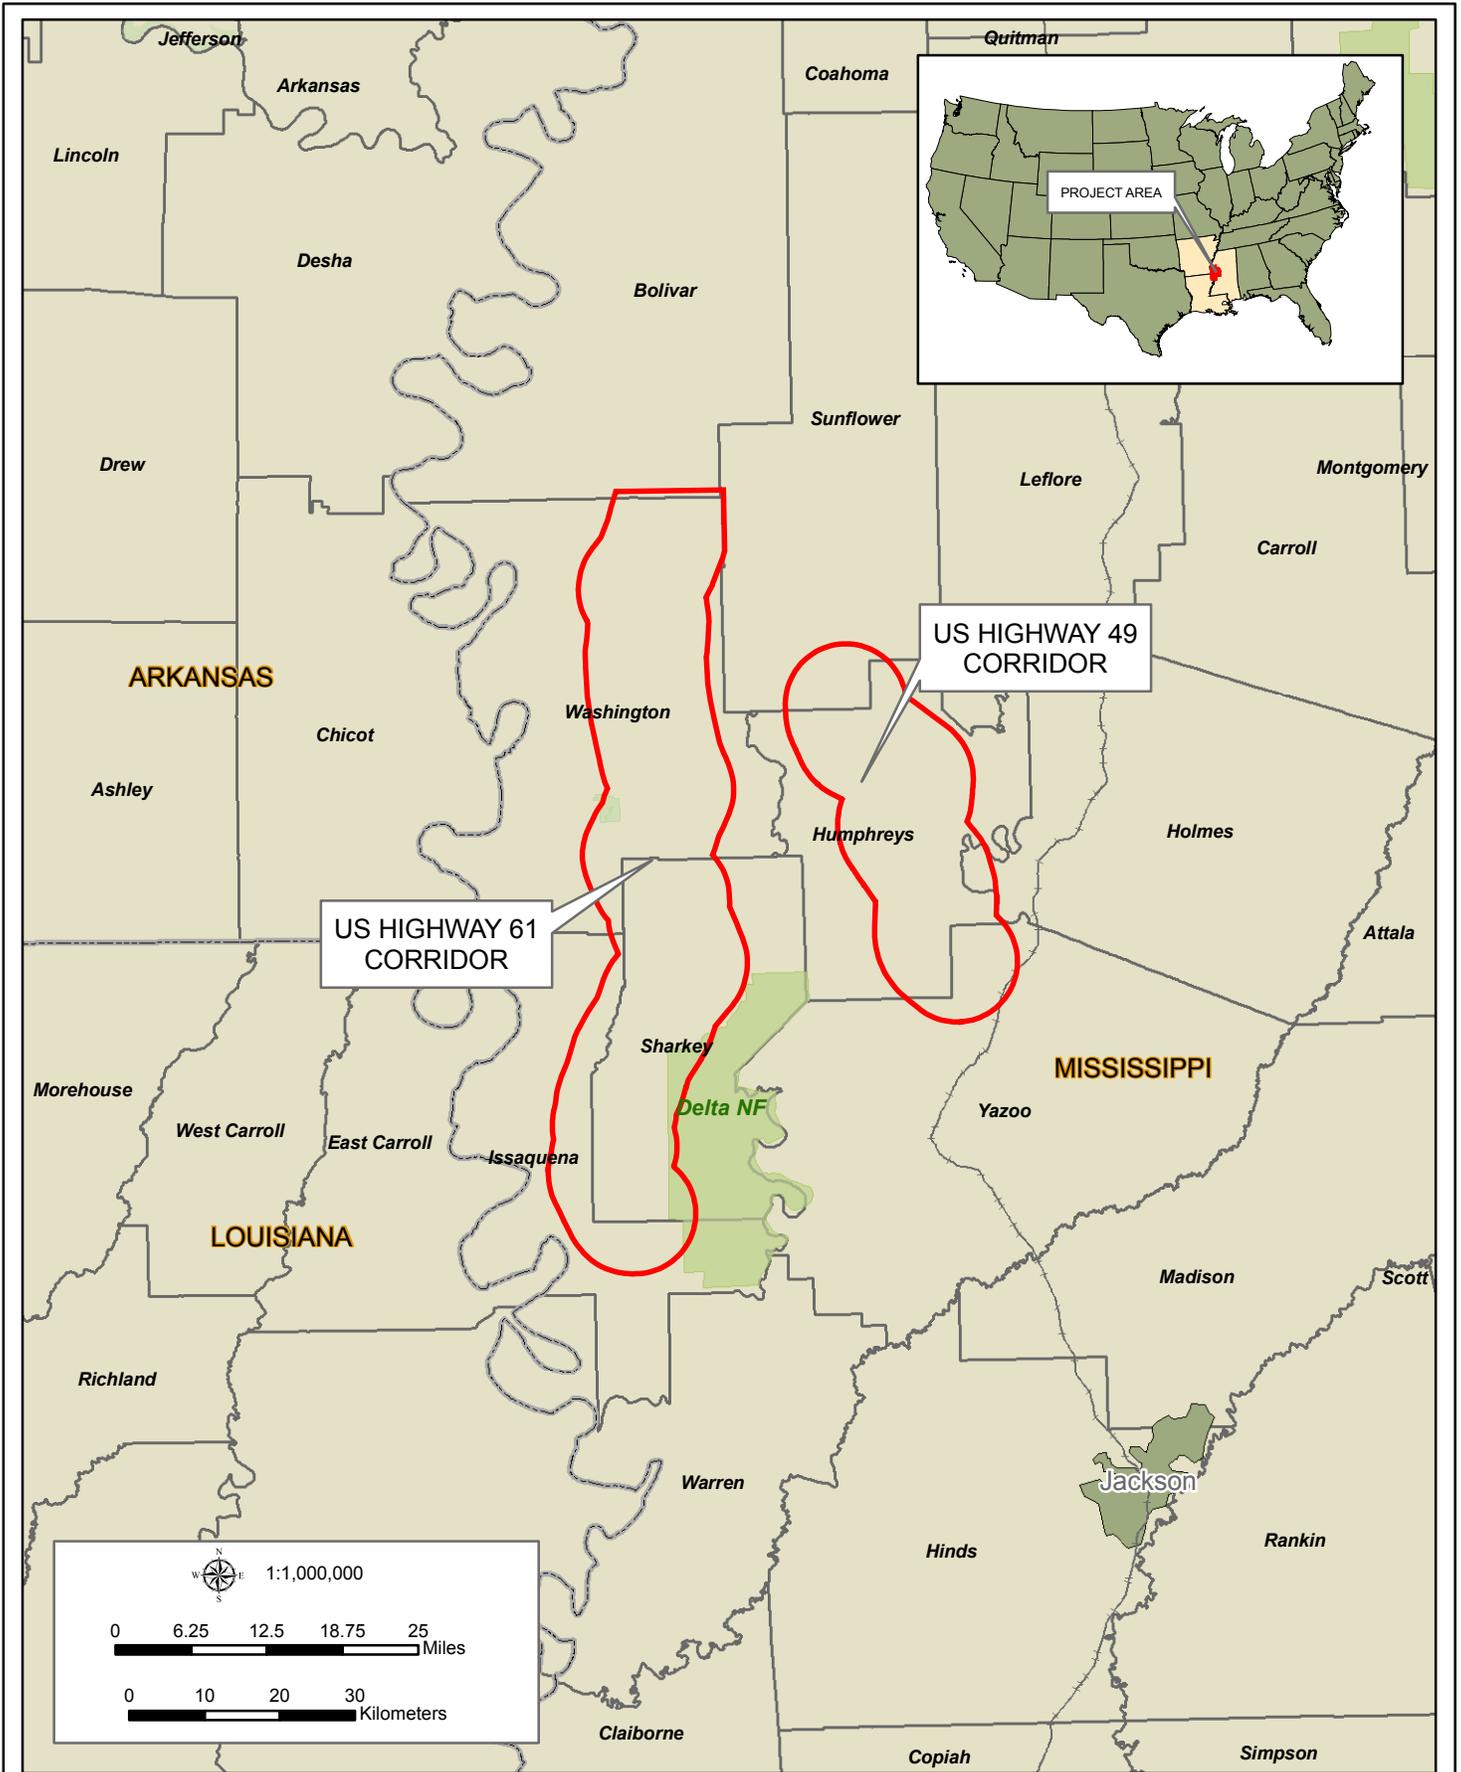

Figure 1: Vicinity Map

Date: June 2007

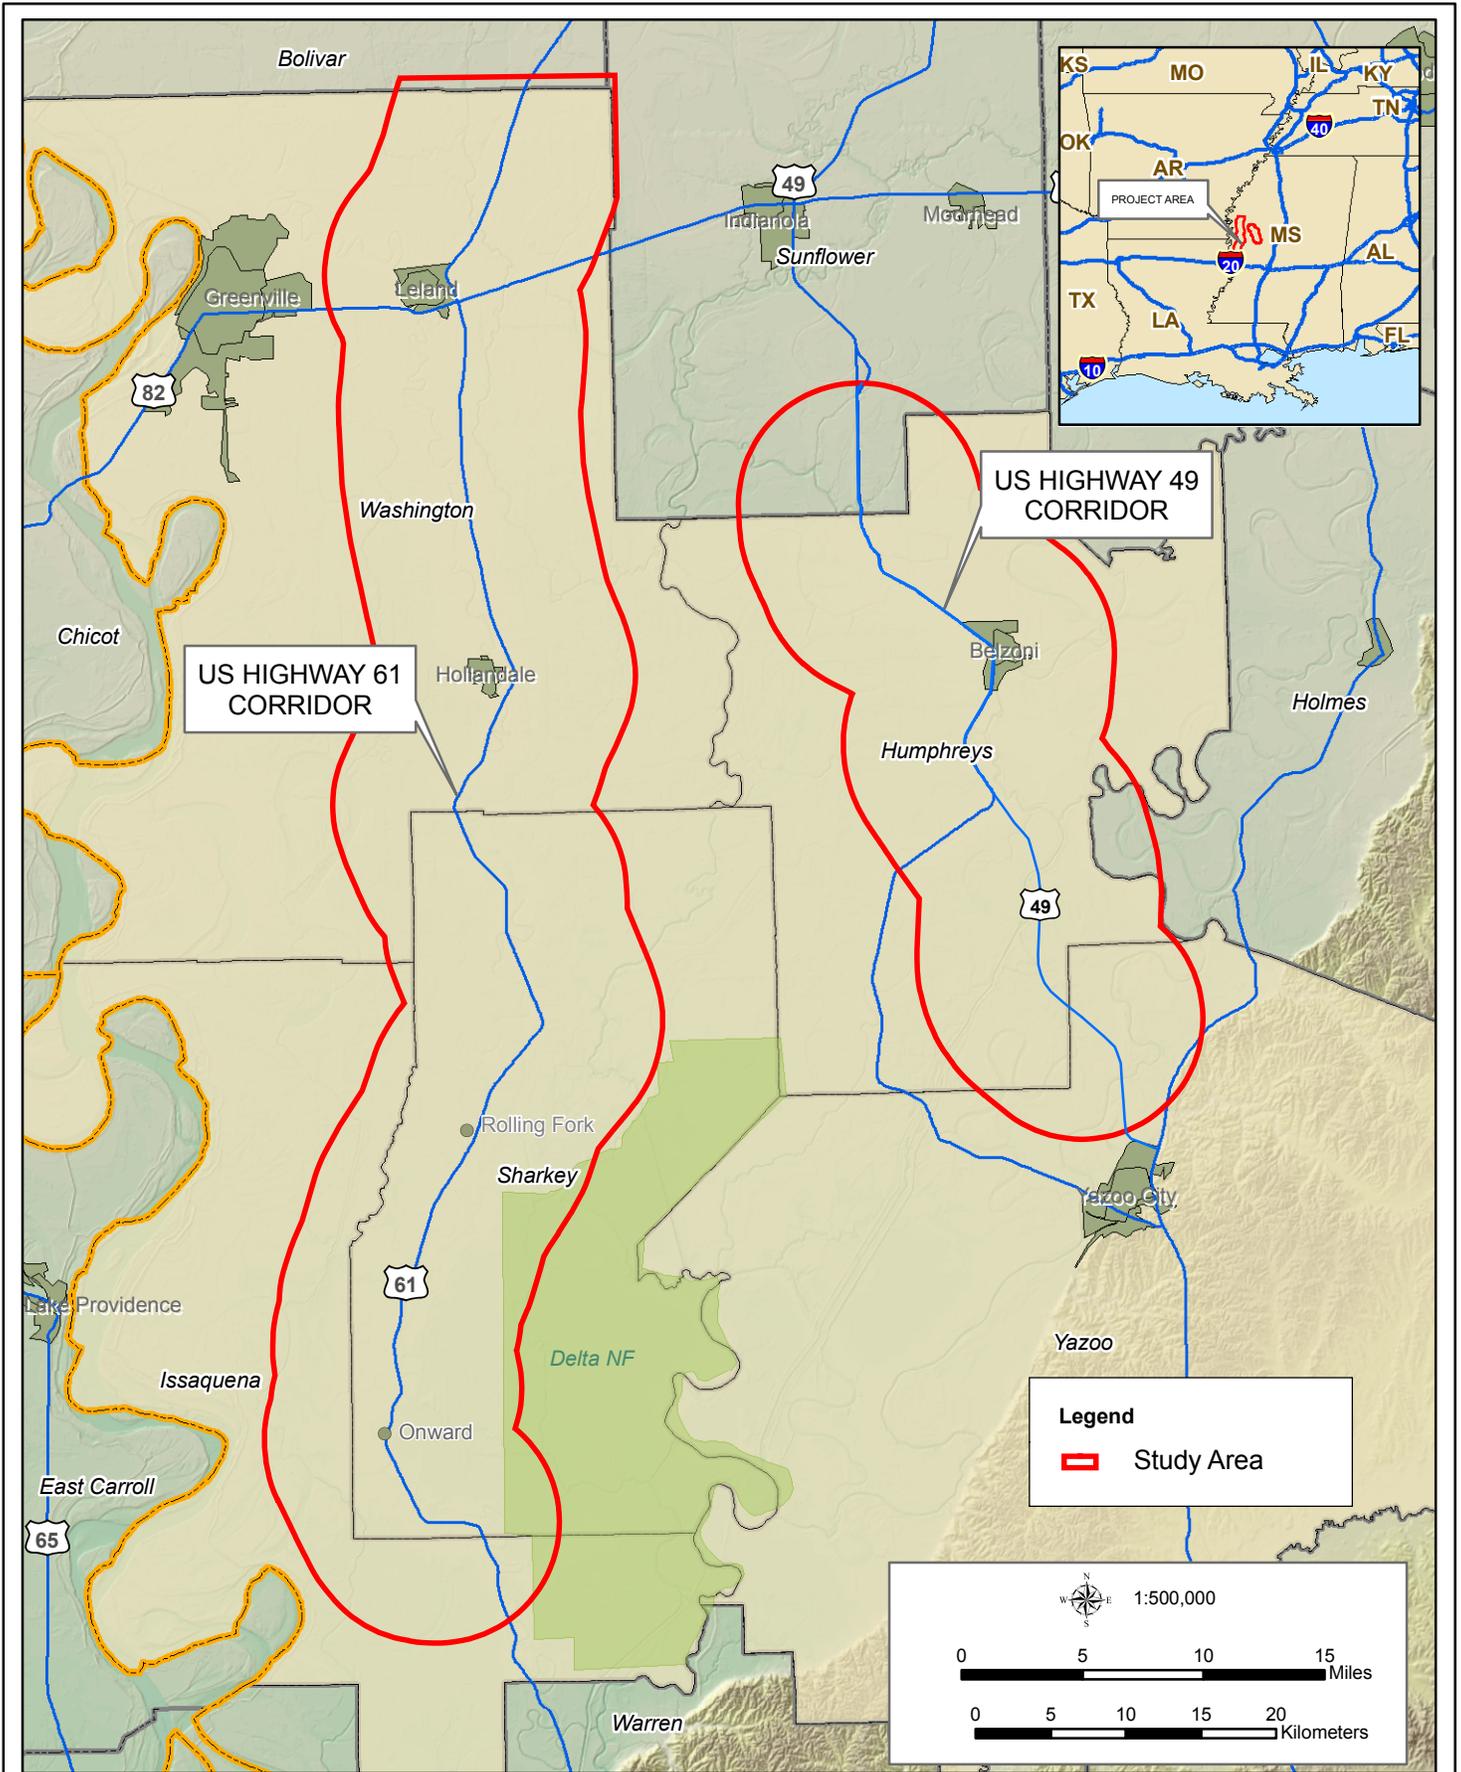

Figure 2: Project Area

Date: June 2007

selection. The meeting was held at the Sharkey-Issaquena Counties Public Library in Rolling Fork, Mississippi, on September 21, 2006 from 6:00 pm until 8:00 pm. US Congressman Bennie Thompson (D–MS) held a community meeting at South Delta High School in Rolling Fork, Mississippi, on November 1, 2006 from 6:00 pm until 8:00 pm. Congressman Thompson invited the Vicksburg District to participate in the discussion, answer community questions, and accept comments and suggestions about the IEC. The following suggestions were made regarding the center’s concept and site selection criteria.

Conceptual suggestions that were presented include:

1. Self guided hiking trails with interpretive signs/exhibits
2. Multi-purpose classrooms and exhibit halls
3. Inclusion of other attractions and features not available at existing public facilities
4. Multi-event interpretations
 - a. Holt Collier/Theodore Roosevelt bear hunts
 - b. Blues
 - c. Native American heritage
 - d. African American heritage
 - e. Flood damage and control (e.g., Great Flood of 1927)
 - f. Agriculture
 - g. Historical events (e.g., Civil War, mass exodus of freed slaves)
 - h. Geologic features
 - i. Literary figures of Mississippi

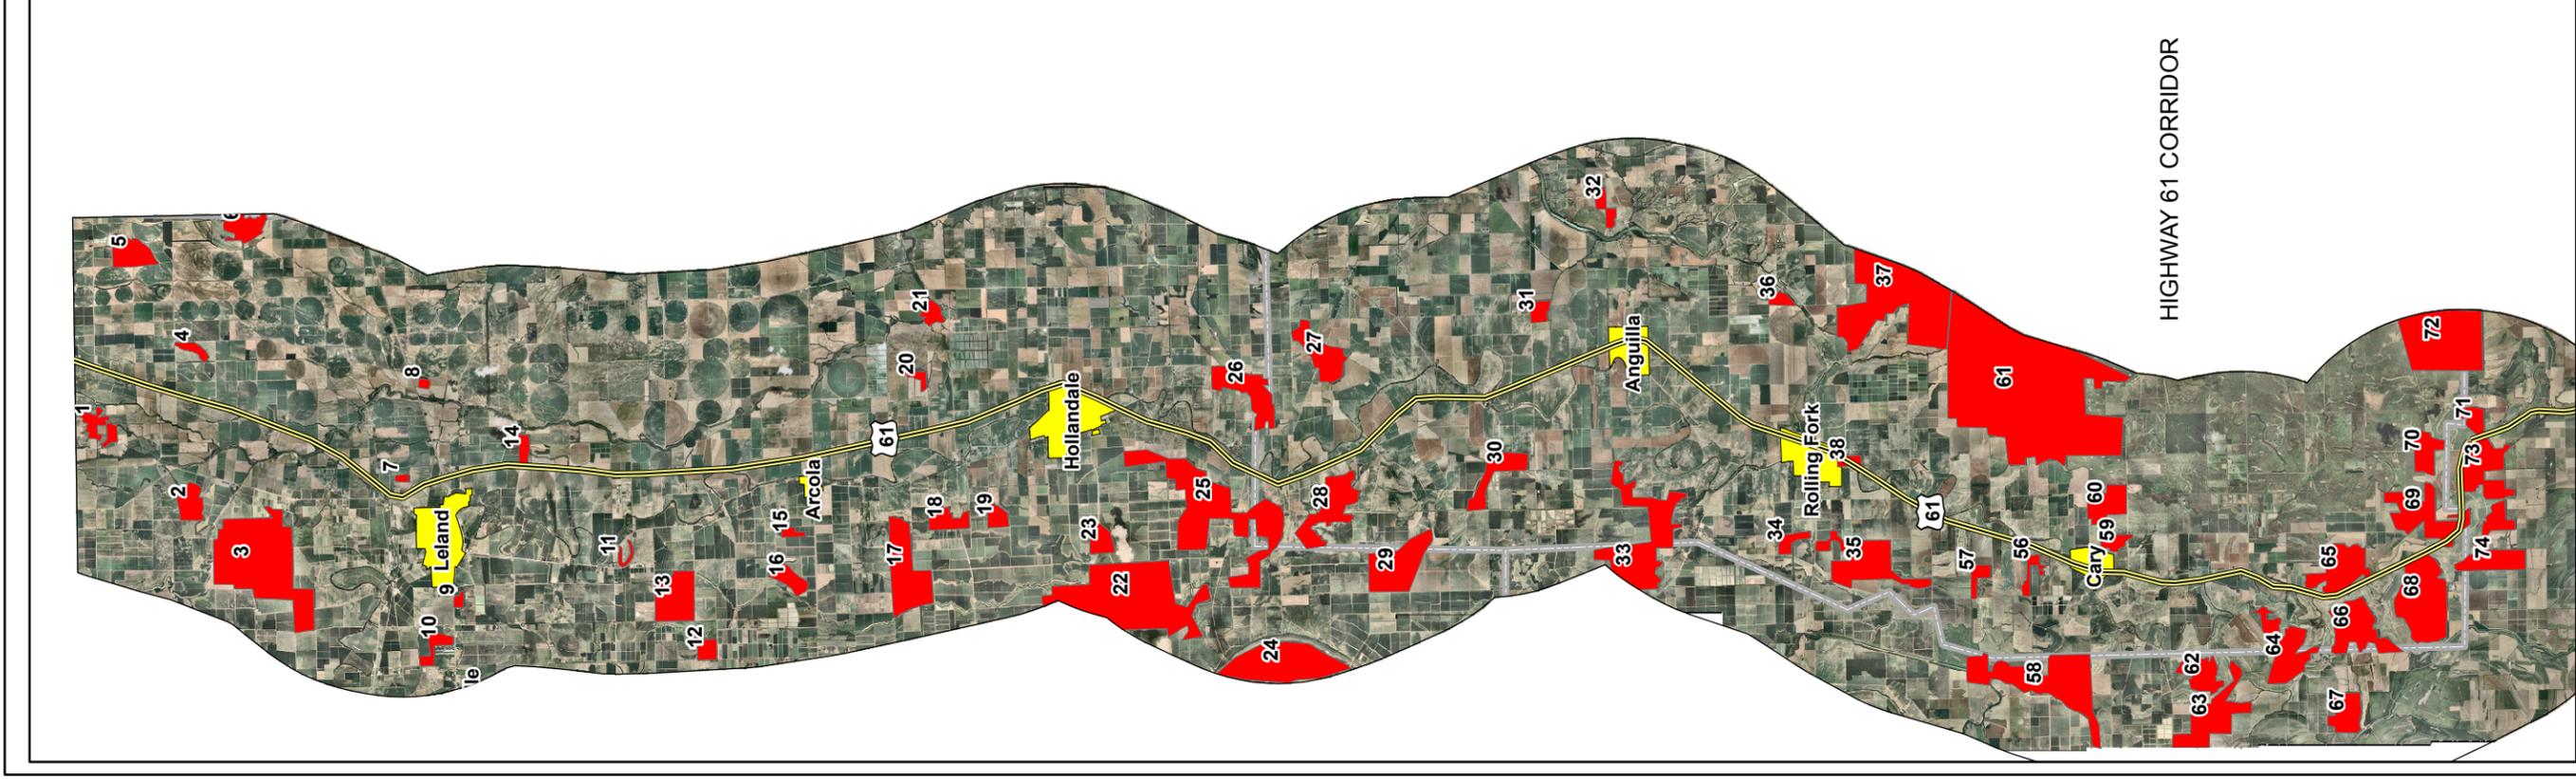

Site Selection Criteria Suggestions:

1. Proximity to U.S. Highway 61
2. Proximity to other infrastructure and public attractions (e.g., Great Delta Bear Fair, Delta National Forest, Mahanna National Wildlife Refuge, Vicksburg National Battlefield Park)
3. Proximity to remaining bottomland hardwood forest habitat
4. Co-locate with other existing public lands/facilities
5. Little or no impact to land values and county/state tax base
6. Proximity to public services (e.g., fire, hospital, police, water)
7. Above the 100-year floodplain
8. Proximity to, but not within, a city/town
9. Proximity to agriculture site

2.2 Geographic Information System (GIS) Database

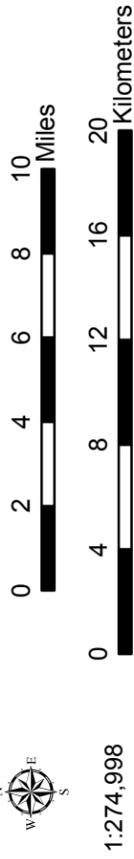

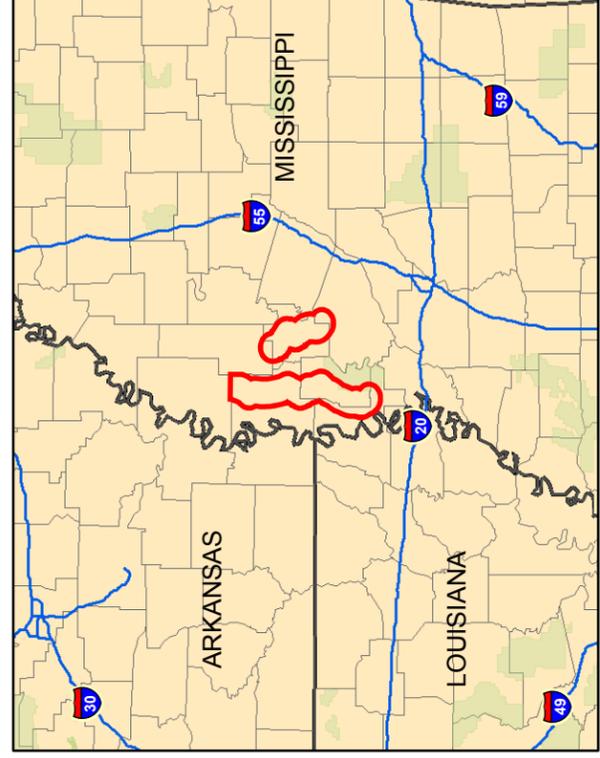

GSRC used GIS databases, including some provided by USACE to identify floodplains, hazardous wastes sites, wetlands, forest stands, water resources and public lands and services. This GIS database was used to screen all the lands within the South Delta region and identify those areas that potentially satisfy the site selection criteria. GIS software ArcInfo created the boundaries of the study area around U.S. Highways 61 and 49. Once the screening in the study area for model variables occurred, field visits to the potential sites were conducted to verify specific conditions on the ground.

Within this study area, forest stands greater than 25 acres were identified and included in the GIS database (Figure 3). The GIS databases also included population centers, public services, U.S. Highways, public and private schools, hospitals, floodplains, major transportation routes,

Figure 3: Study Area and the 74 Sites Selected for Analysis

THIS PAGE LEFT INTENTIONALLY BLANK

lakes, rivers, and streams. National and state parks, Wildlife Management Areas (WMA) and National Wildlife Refuges (NWR), and public points of interest were included in the GIS database (Figure 4).

In addition to the size (*i.e.*, > 25 acres) of the forested area and proximity (5 miles) to major transportation roads, the site selection criteria were grouped into categories:

1. Above or below 100-year floodplain
2. Proximity to public utilities (sewer, water, *etc.*)
3. Proximity to public services (fire, police, *etc.*)
4. Development potential (no hazardous waste, little clearing required, no wetland impacts)
5. Proximity to other public facilities (schools, restaurants, hotel)
6. Proximity to other points of interest (parks, historical sites, wildlife management area)
7. Natural resource conditions (water bodies, quality of forest stands)

Some of these criteria were further subdivided and then ranked according to the distance of the site to the location of other features.

2.3 Site Visits/Data Collection

GIS analysis identified 74 sites for field reconnaissance (see Figure 3). Table A-1 in Appendix A lists the 74 sites analyzed and the county in which the sites are located. USACE subsequently determined that proximity to the Theodore Roosevelt bear hunt site should be weighted as the highest among all site selection criteria based upon comments received from the public and stakeholders. Consequently, 38 sites were identified by the GIS analysis that were within 5 miles of U.S. Highway 61 and U.S Highway 49, contained a minimum of 25 acres of bottomland hardwood forest, and located within 30 miles of the bear hunt site (Figure 5). Table B-1 lists the 38 sites, by county (Appendix B).

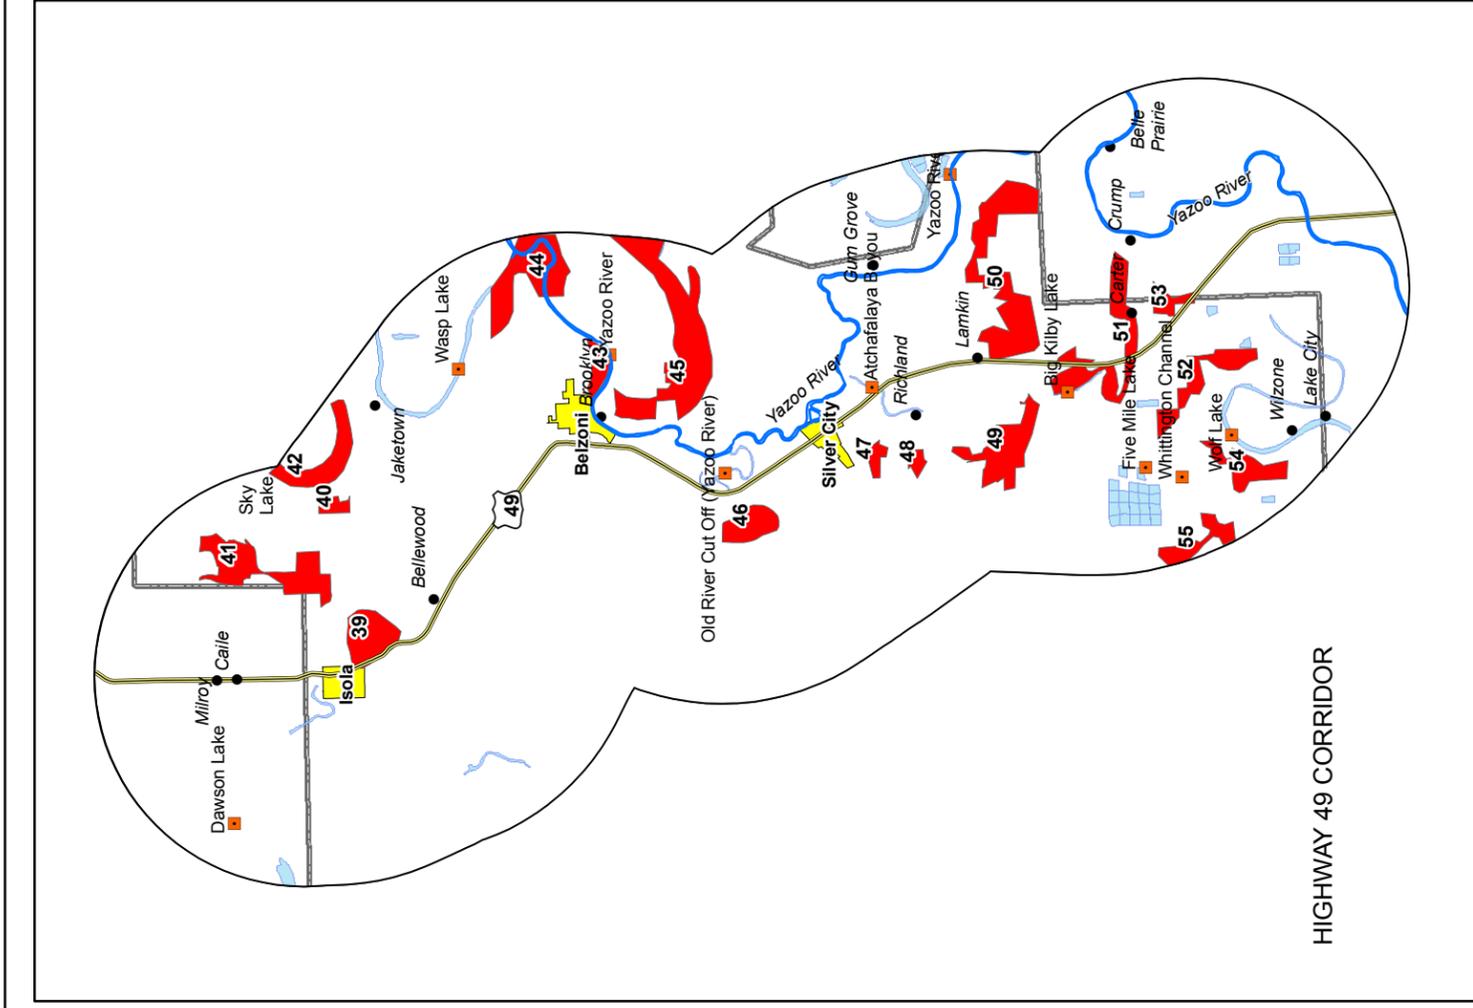

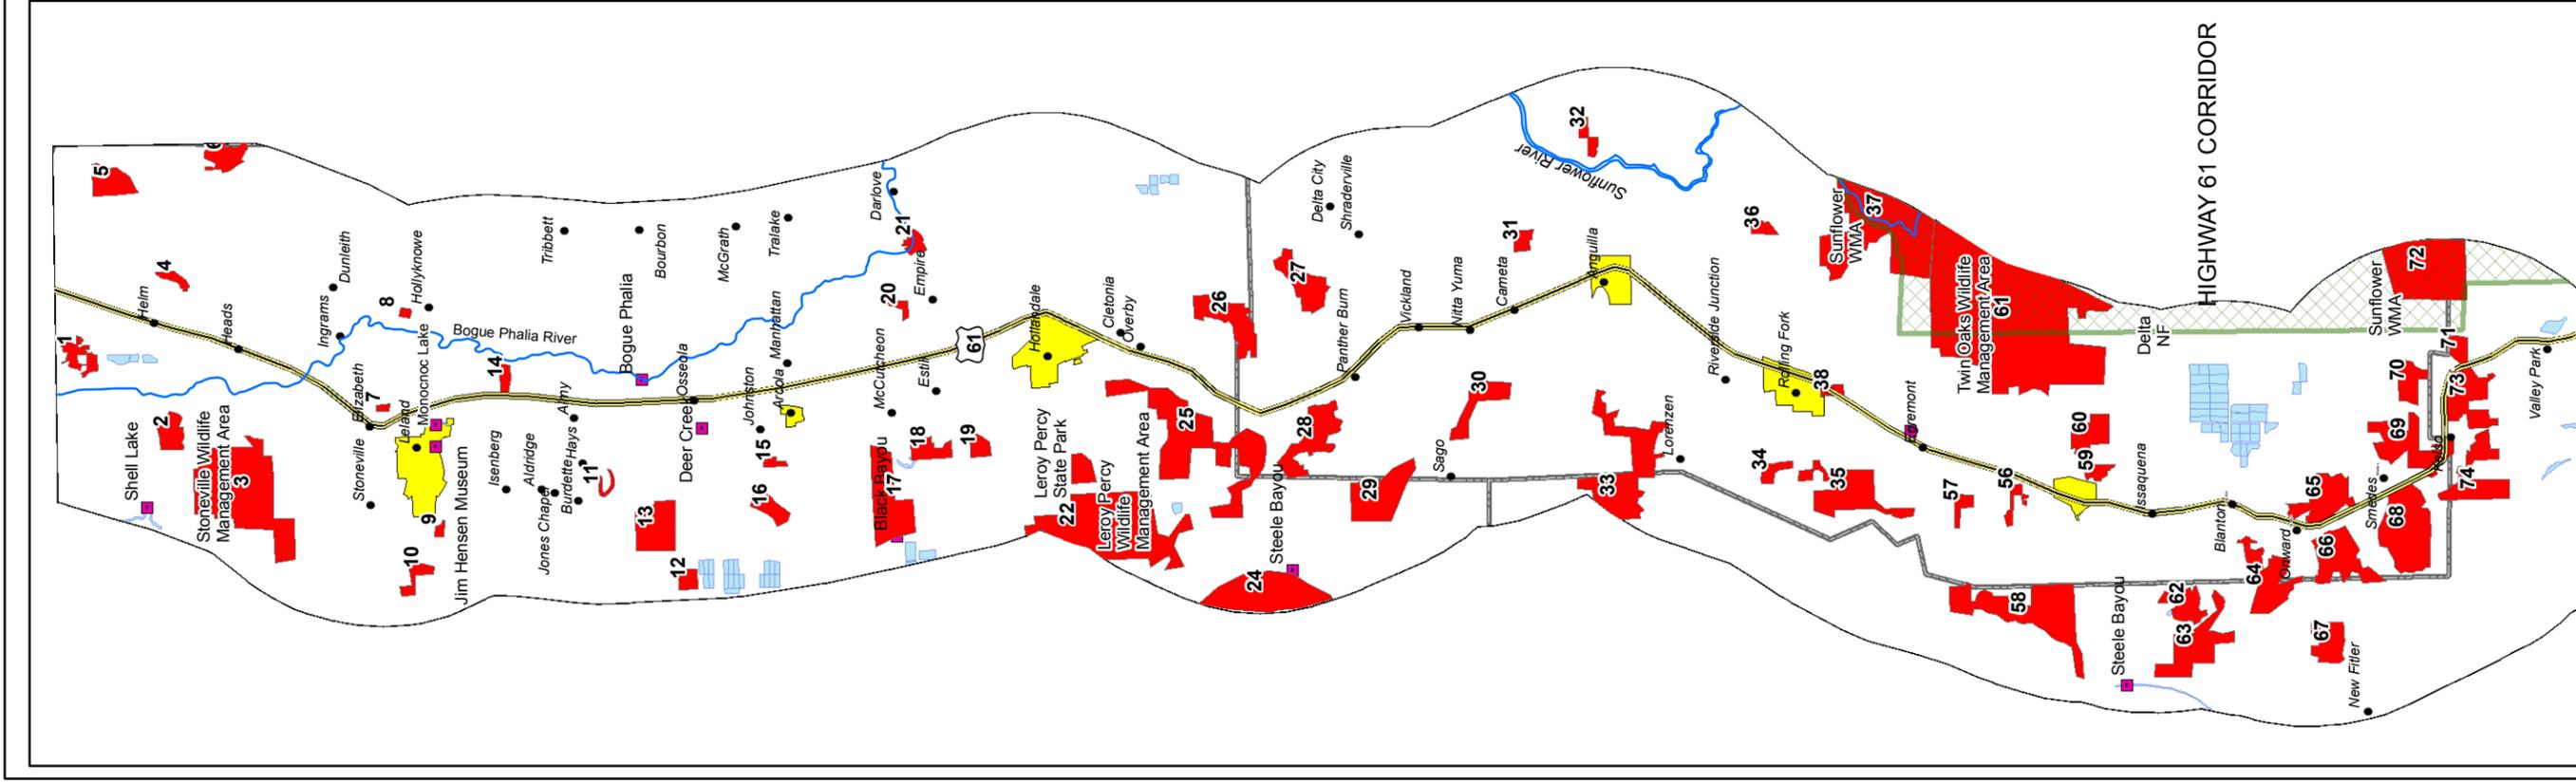

The 38 candidate sites were visited between the dates of March 23, 2007 and April 5, 2007. Field observations included identifying the presence of utilities (power, phone line, sewerage and water), hazardous materials, wetlands, and water resources. Each site was assessed for development potential. The field team determined if the site would require any tree clearing or draining of wetlands in order to construct the new facility. The field team also noted if the site was in close proximity to Indian mounds, lakes, golf courses, historical landmarks or other points of interest. Data were collected on the age of the trees of the local forest stand. These data were then inserted into the site selection model to produce a suitability index (total weighted score).

2.4 Data Analysis

Input variables:

The GIS site selection model included 23 input variables as summarized above. A list of the 23 input variables is presented in Appendix C.

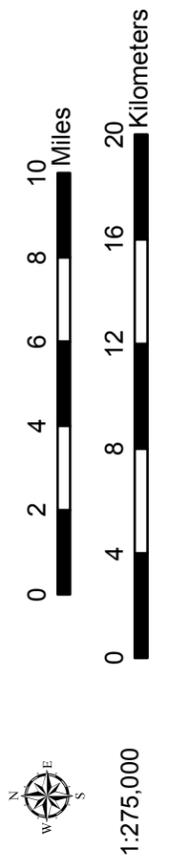

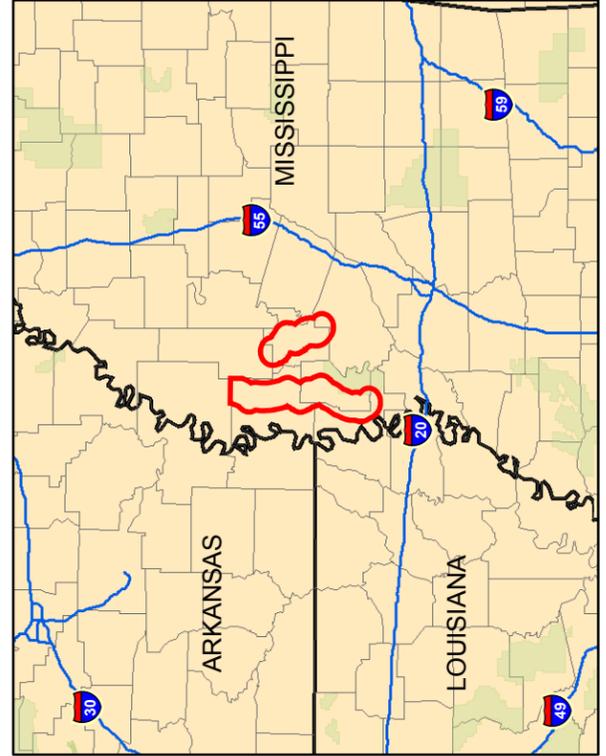

Figure 4: Study Area and Public Lands, Population Centers, Areas of Public Interest, and 74 Sites Selected for Analysis

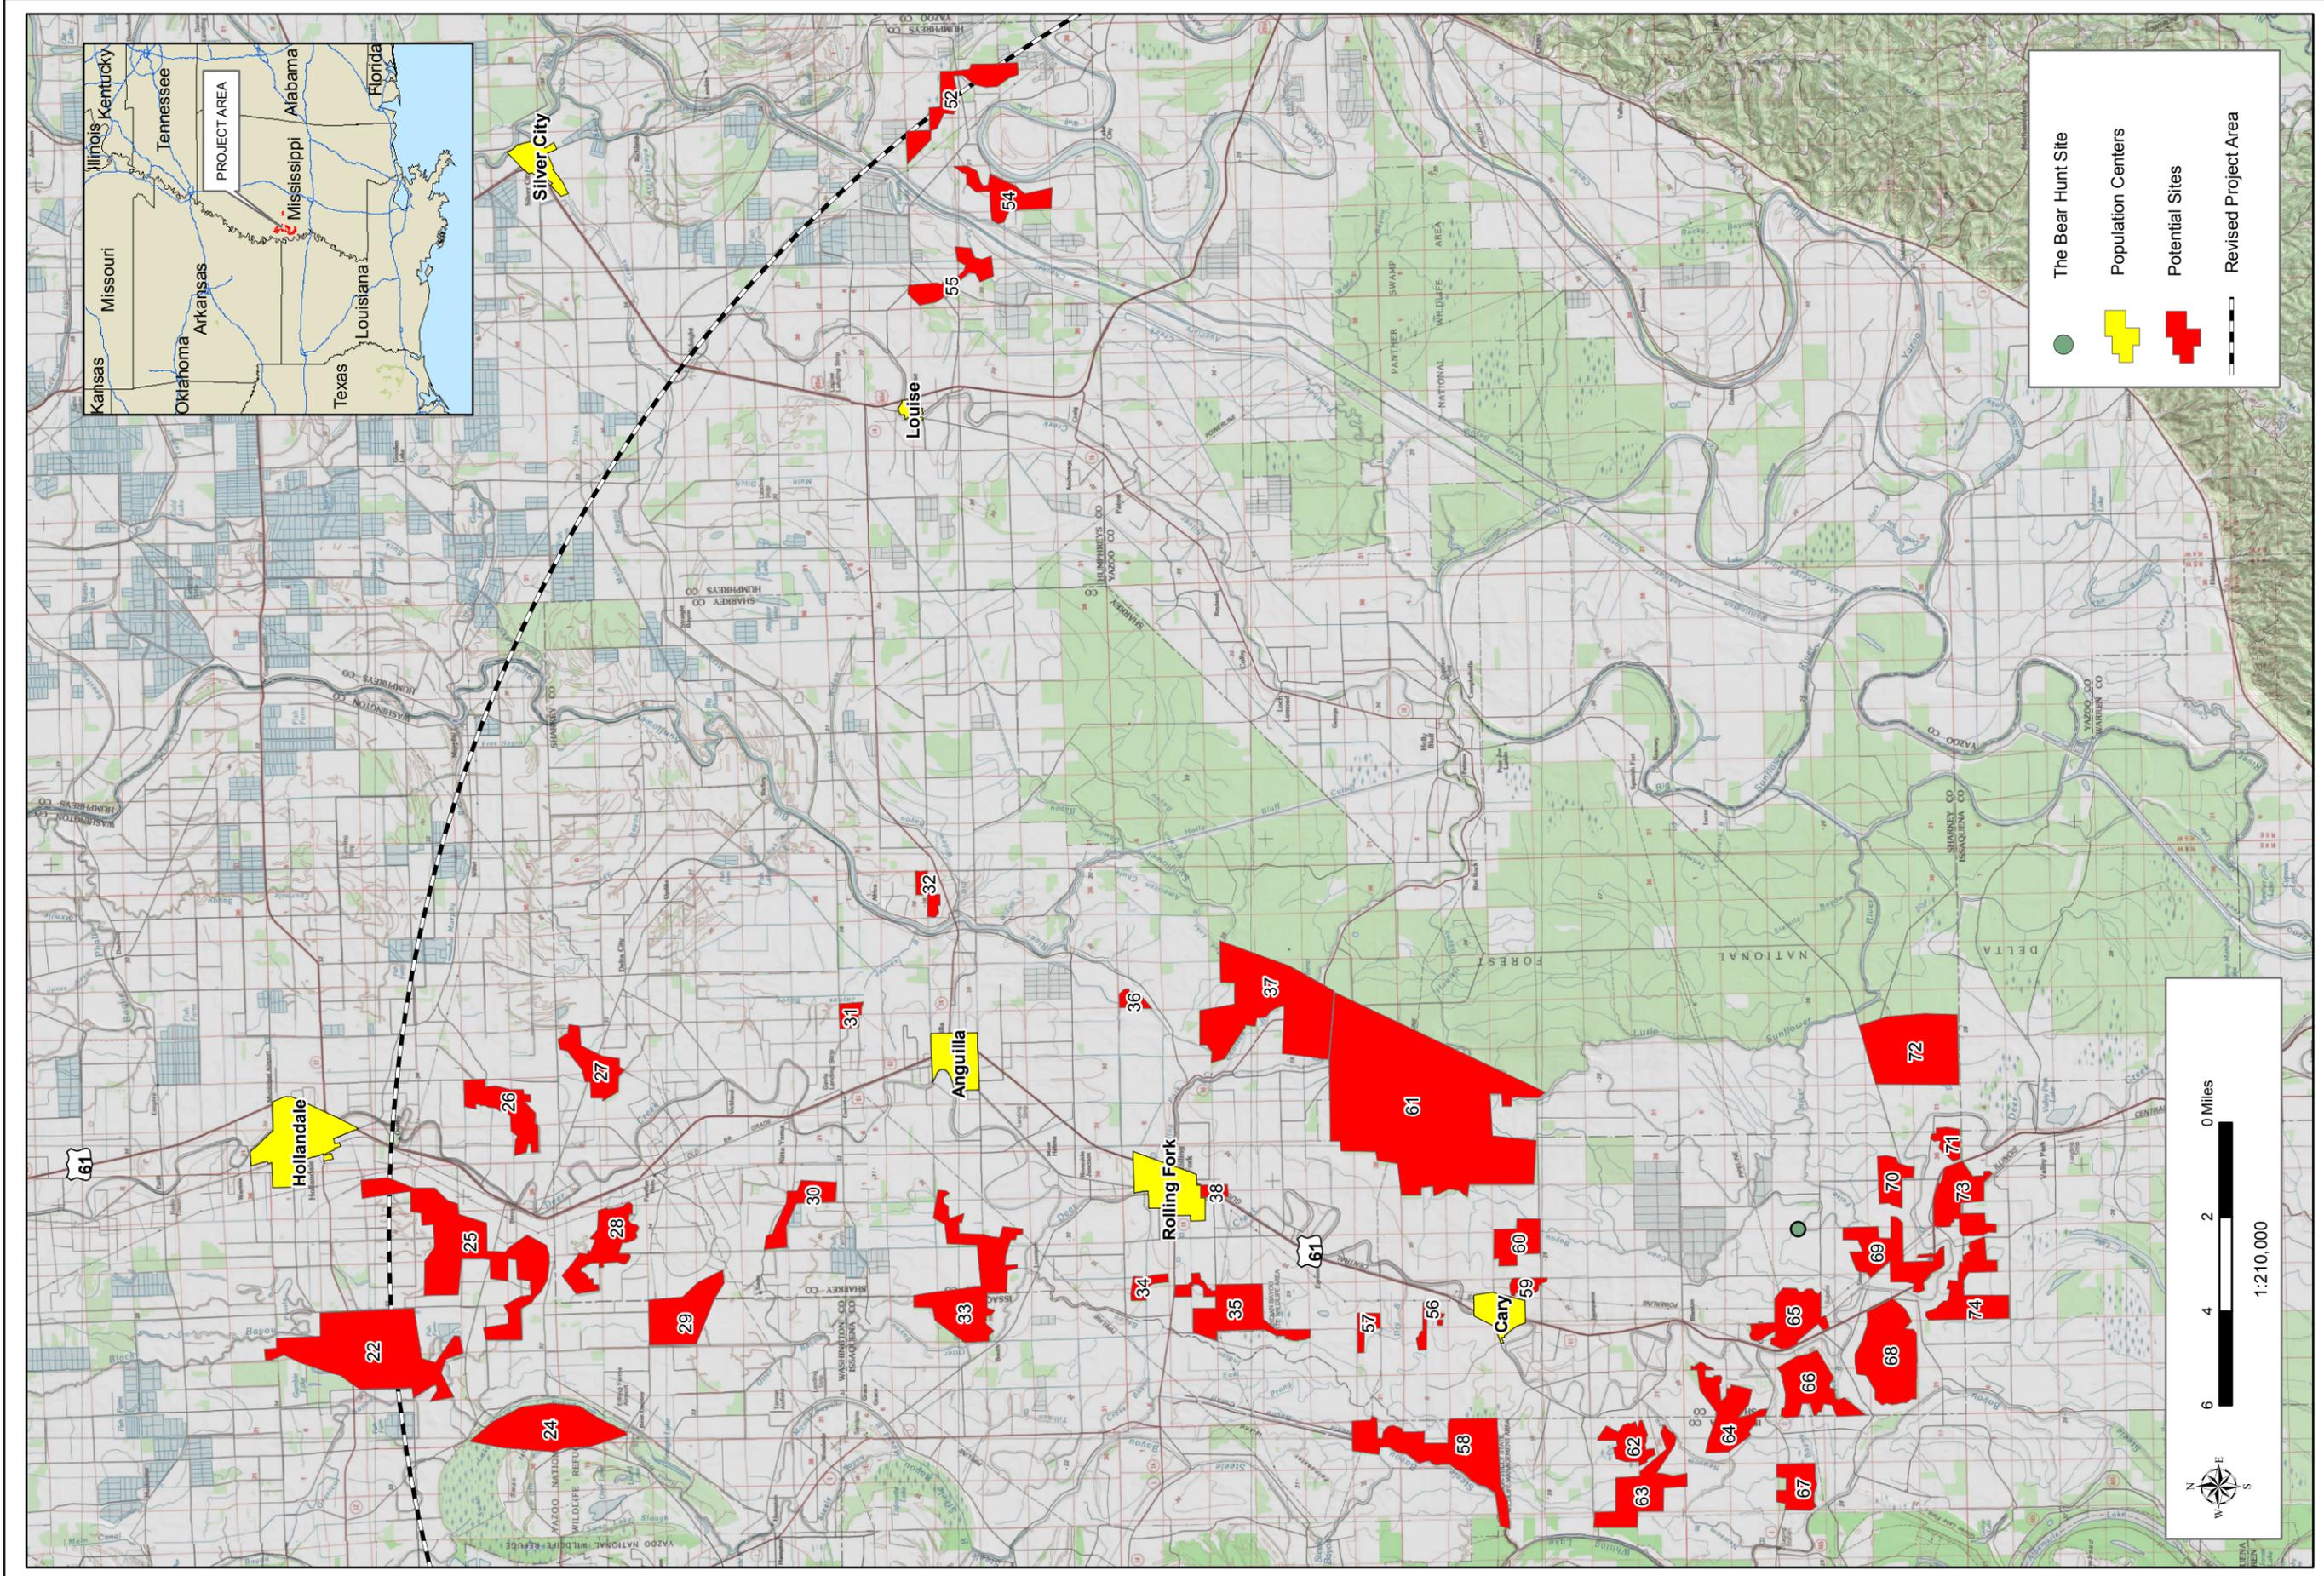

Figure 5: Revised Study Area: Location of 38 Selected Sites

Model Tabulation:

Some site selection criteria were subdivided into more specific parameters. For example, the criterion “proximity to public facilities” was subdivided into distance from restaurants, distance from lodging, and distance from schools. Where site selection criteria were subdivided, the scores of each sub-criteria were averaged. The scores of each criterion were then weighted independently based on their perceived value or importance to the success of the IEC, as described below. The list of input variables and the various weight values are illustrated on the Site Selection Calculation Sheets in Appendix D.

Weighted Scores:

Because some variables were determined to be more important than others, the final computation in the site selection model involved the application of a coefficient called a weighting factor. A weighting factor was used to lend more emphasis to variables that may prove to be more important than others. For instance, the proximity to the bear hunt site warranted a greater weighted coefficient (1.5) than the age of a forest stand (1.3). The un-weighted score or raw score was then multiplied by the “weighting factor” to arrive at a weighted score.

3.0 RESULTS AND DISCUSSION

Five of the 23 input variables remained constant for all 38 sites and did not contribute to the differentiation of the sites. For example, at all 38 sites, there was sufficient area for construction and it would be unnecessary to clear trees or drain wetlands to build new facilities. Therefore, these five variables were removed from the final calculations.

Of the 38 potential site locations, 15 scored 43.0 or higher on the suitability index and are considered to be the best possible center locations (Figure 6). The top sites were all located within 5 miles from population centers. This was primarily because population centers support most of the logistical criteria and were in close proximity to sewerage and water systems, public services, food and lodging and major transportation routes. Therefore, the site selection model suitability score for a potential site tended to increase when the distance to a population center decreased. Remote sites 66, 59, and 64 ranked higher because they were adjacent to U.S. Highway 61 and in close proximity to the original bear hunt site near Smedes.

3.1 Site Selection

The top 15 suitability scores are presented in ascending order to produce a suitability index. The candidate IEC sites that scored 43.0 or higher are presented in Table 3-1 below.

Table 3-1. Top 15 Sites for the IEC

Results of Site Selection Model Suitability Index			
Site Number	County	Size of Site (acres)	Total Weighted Score (Suitability Index)
38	Sharkey	98.0	52.5
57	Sharkey	148.8	51.4
35	Sharkey	1073.2	48.5
33	Issaquena	1624.4	47.6
34	Sharkey	156.3	47.5
36	Sharkey	120.3	47.0
66	Sharkey	868.6	46.6
56	Sharkey	137.4	46.1
59	Sharkey	152.0	46.1
64	Issaquena	833.4	45.9
65	Sharkey	786.4	45.9
37	Sharkey	2678.5	45.0
68	Sharkey	1413.2	43.9
28	Sharkey	820.1	43.8
63	Issaquena	943.5	43.8

4.0 CONCLUSIONS AND RECOMMENDATIONS

4.1 Conclusions

USACE was authorized by P.L. 108-199 to complete a site selection study to find an appropriate site for the new IEC facility. USACE sought public comments and input from local governmental agencies which proved instrumental in constructing the site selection model. Originally, GIS analysis generated 74 potential sites in the South Delta region for analysis. The criteria that the IEC site should be within the vicinity of the Holt Collier and Theodore Roosevelt bear hunt site was added based on public and stakeholder comments and the intent of the P.L. 108. This revision produced 38 potential sites for model analysis. The site selection model simulations produced a suitability index that favored sites near population centers due to logistic variables that included services and facilities commonly found in population centers. Therefore, the top sites are located near the towns of Rolling Fork and Cary. The towns and most of U.S. Highway 61 are above the 100 year floodplain (Figure 7). The remote sites that ranked high, such as sites 64, 65, 66 ranked higher because they were adjacent to U.S. Highway 61 and near to the site of the Theodore Roosevelt and Holt Collier bear hunting camp. All these sites also include one or more public points of interest such as lakes, rivers, parks, and Native American cultural sites.

4.2 Recommendations

If the U.S. Congress authorizes additional funding, USACE should further investigate the 15 highest scoring sites of the site selection model's suitability index. USACE should assess each of these sites to locate where on the site the IEC facilities would be installed (some sites are over a 1,000 acres) and to determine if any additional work is needed to install the utilities or pave access roads.
